Abstract

This paper is to analyze the ODA (Official Development Assistance) recipient countries in terms of governance by using machine learning method and to put forward the ways to enhance the effectiveness of ODA projects conducted by the donor countries. It has been widely and commonly accepted that the governance system of the ODA recipient countries should be improved in order for the ODA projects to be successful and fruitful. However, as it stands at the moment the governance system of the developing countries is too weak and has a long way to go to an internationally accepted standard. In this regard, this paper attempts to classify the developing countries in terms of governance through the machine learning system and to suggest the ways by which the ODA projects provided by the donor countries can be effectively implemented in the developing countries.

Keywords: ODA, machine learning method, governance
