Abstract

This work attempts to demonstrate that all languages in the world are related and have commonalities with one another. Through empirical examples and specific words in several languages or dialects, we demonstrate the bridges connecting them. We demonstrate how to derive an algorithmic rule for human linguistic construction. It demonstrates that there is no mother tongue or original language. Human language possesses a single nucleus that is generated in the contexts of communication and social interaction. Its vocabulary is then accumulated as needed and compiled into dictionaries.

Keywords: Langage, Lagage Nucleus, Communication Contexte, Social Interaction
